Concerning collaborative analysis of sugars with differential Phmetry

Epernay, 16th may, 2006

A collaborative analysis concerning the quantification of glucose and fructose contained in wines, with differential Phmetry, was organised by the laboratory of CIVC in march 2005 and august 2005 in view to validate the method to be recognized as a standard method by the OIV (Intergovernmental Organisation for Wine and Vines).

On both times CEM participated and send us results, which were statistically significant and have been kept for final computing of the reproducibility of the method.

The method has been discussed by the Sub Commission of Methods of Analysis during its March' meeting and forwarded for adoption as international standard at the next OIV general assembly next June.

Dominique TUSSEAU
Responsable du laboratoire
